The leadership of the municipal government came to CCT to check the security work

At 09:00 AM on January 16, 2009, Mr. Li Feng, the deputy mayor of Shenzhen Municipality, visited CCT with group from Administration of Work Safety of Shenzhen

Municipality and Shenzhen Municipal Communication Bureau to inspect CCT's Safety & Security work.

Mr. Zheng Shao Ping, the president of CCT; Mr. Zhang Ning, the deputy GM of CCT, Mr. Wang Fu Chang, the manager of Safety & Security department and Mr. Lu Bao Di, the deputy director of Security Committee from China Nanshan Development (Group) Inc. received the guests.

Mr. Zhang Ning reported the details of production status for security, security system and cost for security production of CCT.

Mr. Li Feng acknowledged the performance of CCT's security works and encouraged CCT to overcome the impacts caused by the economic crisis to keep up

with the high-level security work while he was witnessing the operation scene of MSC sola (capacity is 11,000TEU) at berth 13#.

Supporting Facility

CCT adopts the 2nd self-established technology of ERTG conversion

It has been 4 months since the actual launching of the automatic electricity adopting & off-circuit over-head DC technology on CCT's "Oil to Electricity conversion", a 930 meters long of a trolley line has been working well, and reached the requirements.

Among the various "Oil to Electricity" technologies, the over-head DC technology is creating the least impact to the on-site operations; besides the

energy saving property has been an outstanding key performance. But on the other hand, it will still take rather large investment and long construction period to see the completion of this project. In order to maintain the positive aspects and minimize the negative aspects of the over-head DC project, CCT successfully designed “Low-trolley (Height) DC technology, and pilot test proved workable.

Therefore, the “low-trolley DC technology” is to become another prominent remark of RTG conversion technology.

CCT has also made the simulation according to the environmental inspection figures, it is said the “oil to electricity conversion” is accomplished; it will greatly reduce to the emission of hazardous object, which will benefit society. It is estimated to reduce 69 tons hydro

carbonate, 3619 tons of nitrogen oxides, 1448 tons of carbon monoxide, 214 tons of sulfuric compounds and 54 tons of particulates.

The project will be fully completed by September 2009.
